All Students Belong in ‘The New Zealand Curriculum’: A vision supported by the Inclusive Education Capability Building Project

Anne-Marie McIlroy

ABSTRACT
This article describes the Ministry of Education’s Inclusive Education Capability Building Project (2013-2014). Project members were tasked with creating resources for professional development that would be used to grow inclusive practice in New Zealand schools. This article also shares the learning journey of some members of the project team as they engaged in the inquiry process around inclusive practice. A key understanding for this project was that all students can be successful learners and belong in The New Zealand Curriculum (Ministry of Education, 2007), also referred to in this article as NZC.

Research Paper

Keywords: Inclusive education capability building, inclusive practice, inquiry, professional development

BACKGROUND
The Government’s vision for a fully-inclusive education system is supported by Success for All – Every School, Every Child (Ministry of Education, 2010). An Education Review Office report (2010) claimed 80% of schools will be mostly inclusive by 2014, a 30% improvement from 2012. The Inclusive Education Capability Building Project (Ministry of Education, 2013b) was one of a number of responses to this vision, and the project was designed to build confidence in schools, enabling all students to access authentic learning, meaningful teaching, and positive relationships. Inclusive cultures are strengthened when teachers feel confident they have the skills, resources and knowledge to teach all students (Ainscow, Booth & Dyson, 2006).

UNDERSTANDING INCLUSION
Inclusion is about the full participation and achievement of all learners at school (Ainscow, 2005; Morton, Rietveld, Guerin, McIlroy & Duke, 2012; Slee, 2011). In inclusive schools, children and young people with special education needs are engaged and achieving through presence, participation and learning (Ministry of Education, 2012). Historically, the concept of inclusion grew out of the mainstreaming movement which was essentially about placement of a disabled child in a regular setting with a resourcing package. For some schools, inclusion is still thought about as “a technical problem, in which schools must calculate the correct mix of resources, expertise and personnel to facilitate the placement of the child” (Ware, 2002, p. 154). A technical response is more likely to happen when inclusion is largely understood as being about special education, and not as what schools do to support all their students (Ainscow, 1999; Slee, 2001b). Inclusion is about quality teaching and learning for all students rather than special education for some students (Ballard, 2011; Morton et al., 2012; Slee, 2001b; Slee, 2011) and is central to discussions about curriculum and improvements in schooling (Ainscow, 2008; Curcic, Gabela, Zeitlina, Cribaro-DiFattaa & Glarnera, 2011). Slee (2000) states that “inclusive schooling is not a synonym for assimilation” (p.5) and that an attempt to normalise difference is misguided and results “in stabilising the newcomer in an environment that provides a buffer to enable schools to remain the same” (Slee, 2001a, p. 173). Inclusive schools, therefore, are schools that value diversity and make fundamental changes to provide educational equity and meaningful learning opportunities for all students. An inclusive school
is one based on democratic principles focused on collaboration, the celebration of diversity, community engagement, and flexible delivery of the national curriculum (Curcic et al., 2011).

**STARTING OFF – LOCATING THE VISION**

The Inclusive Education Capability Building Project could be described as a creative and innovative response to the Ministry of Education’s commitment to inclusive practice through quality teaching and learning throughout the sector (Ministry of Education, 2014a). It was a response to feedback from some teachers who said they didn’t feel confident to teach students who require the highest levels of support to participate meaningfully in the curriculum (Education Review Office, 2010). This was reported as being particularly challenging in senior secondary school classes. Project resources and materials created by the Inclusive Education Capability Building Project team were intended to support school communities so teachers felt more confident to teach all students. It was intended that through meaningful teaching and learning, students would have equitable access to the knowledge and resources that allow them to develop capabilities and values to live full, satisfying and connected lives (Ministry of Education, 2007).

Responsibility for this project was shared between the Curriculum Teaching and Learning team and the Disability Strategy team of the Ministry of Education. This shared responsibility sent a clear message about all students with special education needs belonging within the NZC (2007). Alternative curricula are not required to teach students labelled as disabled.

This project was framed by an inclusive inquiry-based approach that affirmed the classroom teacher as the leader of learning for all students in their class. The team recognised there was strong evidence for using ‘regular’ teaching strategies with the majority of students with special education needs (Alton-Lee, 2003; Ministry of Education, 2013b). Project members were practitioners from the professional learning and development environment, and from primary, secondary and special schools who had experience around inclusive practice.

The values and goals of Ka Hikitia (Ministry of Education, 2009b; 2013c) and of the Pasifika Education Plan (Ministry of Education, 2013a) were embedded in the thinking and intended outcomes of this work. This was particularly important as Māori and Pasifika learners disproportionally under-access special education services and support, yet are over represented in statistics reporting numbers of students who are described as having special education needs (Ministry of Education, 2013b). This means actively valuing relationships, family and community is essential to creating inclusive schools (Macfarlane, Macfarlane, Savage & Glynn, 2012).

**Project Structure**

The project team operated as three work streams over the course of a year. One work stream developed a framework for inclusive practice for use by all professional learning and development providers, leaders and teachers. The focus for this work was largely around school systems and processes, and included topics such as working with teacher’s aides, individual education plans, and roles of boards of trustees. The second work stream developed a suite of tools to support the NZC for use by teachers of learners with special education needs. Curriculum examples included teacher action, student voice, practical ideas in relation to support staff, and ideas for creating social connections between peers. For example, a teacher could engage with material that suggested how a Year 13 NCEA achievement standard in English may be adapted and differentiated to enable meaningful teaching and learning for a student working in that class within Level 1 of the NZC. The third work stream created a progress and achievement framework intended to support leaders and teachers of learners who are described as having special education needs. Particular attention was given to assessment approaches that validated teaching and learning for students who are often invisible or failing within standardised assessment processes. The assessment approaches discussed are strengths-based and support meaningful teaching and learning with clear examples. The Ministry of Education’s project ‘Through Different Eyes’ (Ministry of Education, 2009a), the Ministry’s position paper on assessment (Ministry of Education, 2011a) and Collaboration for Success (Ministry of Education, 2011) provided strong support for this work.

**THEORETICAL PARADIGM**

The project work was located within sociocultural theory. Rather than understanding knowledge as existing in the heads of individuals or in the external world, sociocultural theory positions knowledge as negotiated at the intersection of culture, individuals and activity (Cowie & Carr, 2009; Ministry of Education, 1996). Project members worked together in communities of practice to collaboratively grow a knowledge base from which to springboard practical support for growing inclusive school communities (Wenger, 2000).

When considering the diversity of the professional learning and development landscape, the project team chose to focus on how the resource might add...
value for the student who is actively positioned at the centre of learning. Attention was given to the role of the teacher and accessibility of the resource. Making spaces to hear student, family and peer voice was made visible. Connections between theory and practice were made by embedding many examples of teacher, student and family thinking and action throughout the project materials. For example, hearing from family that a holiday involving plane travel is a goal, means the teacher can incorporate skills and knowledge required to travel successfully in a plane into the class programme. A student may have a goal of learning to watch a movie using headphones, and this could be supported at school in the class literacy programme. While the meaning and reality of learning and achievement are considered across curriculum levels, focus was on the participation, progress and achievement of students for whom much of their learning is within Level One of the NZC (2007). Thinking, strategies and resources that support the students with the highest levels of need can support the learning of all students. The idea that “when we get school working for students with the highest level of need then we’ll have it right for everyone” was a comment frequently used to ground the project teams in their work. When students are visibly present in the NZC, belonging is supported. Conversely, if disabled students are working with alternative curricula, the message is the NZC is for all students except those who are disabled. This does not support the vision of the NZC, nor does it support inclusive practice.

Key thinking guiding the development of these resources was focused on student reality. Would I feel welcomed in this school culture? Does my teacher need to know more about how I learn? Does the leadership team in my school give my teacher enough support? What does my teacher need to learn how to do to help me learn and achieve as much as I can within the NZC alongside the other students in my class? How are my learning and achievement measured? How do my family find out about how I am doing at school? By positioning the student at the centre of this work, the relationships that support collaborative learning are prioritised, and the reality of teaching and learning in the classroom is the practical focus necessary to support authentic learning.

RECORDING THE JOURNEY AND LEARNING FOR TEAM MEMBERS

The author of this article was a member of the Inclusive Education Capability Building project team. Midway through 2013, at the beginning of the project, a conversation between the author and Joanna Curzon of the Ministry of Education led to an agreement where the author would in some way record the journey of the project. At a full group project meeting, the author outlined the plans to write a narrative of the work and offered all members the opportunity to participate. Key headings were suggested under which team members’ thoughts could be grouped. The five members who chose to become involved shared their thoughts or recorded them under those headings. The author guaranteed that no names would be used, and that material recorded in the article would not be harmful if the authors were identified. At all stages of the writing, drafts were sent to participants for checking and approval. Drafts were also sent to the Ministry of Education staff who have been aware of this work.

THE JOURNEY AND EARLY LEARNING FOR TEAM MEMBERS

Throughout the year of the project, team members co-constructed materials in Wellington and gathered regular feedback in their home areas throughout New Zealand. They received support from a wealth of expertise both within the Ministry of Education and from those with specialist knowledge brought in to help guide the thinking and learning in the early stages of the project. Members made comments which suggested a sense of joy in being able to work in an area where many feel passionate. Comments included:

I feel incredibly lucky to be part of this group; it’s a dream come true.

It takes time to collaborate. it is really untidy this working together, but it’s so worth it.

Work streams took time to plan, to research, and to develop trusting relationships with each other which enabled challenging conversations to occur safely. Over time, project members experienced new learning in different ways. Enthusiasm was tempered with the seriousness and challenge of the tasks in hand. Project members were active learners alongside their colleagues and within the schools where they were working. This project was not about application of a model, but about all participants co-constructing and imagining ways forward which would support teachers in the reality of their classroom practice. The goal of creating change required schools not only to reach a tipping point, but to have the ongoing support to embed new practices. Comments heard included:

Sometimes I am just not sure what we really mean by inclusion; schools have so many different views.

This is messy work but I really believe transformation comes from dissonance.
Unless we all keep a close eye on our students with the most complex needs then we’re not talking about inclusion. Inclusion has to be everybody.

This has to be about teachers and students. We have to be practical and be able to support ideas with practice.

I’m afraid that we might not make a difference. What if there isn’t the roll-out to support this work? What if we just end up with a resource that sits on a shelf? How’s that going to help schools?

Project members talked at length about the busy reality in schools, what could work, and what was and was not negotiable in pursuit of inclusive practice. Teachers on the team constantly brought this work back to classroom realities. There was a developed understanding of the need to be practical.

Some project members were at times challenged when each piece of work produced was examined as to its value for students with high and complex support needs. One project member said:

_These students with high and complex needs, where are they? They’re not in my area._

Project members had to keep reminding themselves of the importance of teachers being able to think about the applicability of this work for any student. The thinking behind making the NZC meaningful for students on the margins is relevant for all students. Team members recognised different schooling options for some students depending on where they live. The focus of this work was on all school communities feeling confident to teach all students living in that community.

**WRITING AND GATHERING RESPONSES TO RESOURCES**

The project work moved from a predominantly researching phase to a writing phase. An environmental scan of both national and international material designed to support students with special education needs confirmed how lucky we are in New Zealand to have a curriculum that enables creativity and flexibility, and can work for all students (Hipkins, Bolstad, Boyd & McDowall, 2014). It demands reflexivity from teachers and high expectations of all. Project members found the curriculum document was a great place to begin discussions about inclusion when working back in their local schools.

_Even when schools understand that inclusion is about everyone, it is helpful for them to see what the curriculum looks like in action. It takes a bit of imagination to meaningfully include a student who may not read or write in a Year 12 history class and then assess that student’s learning. Narrative assessment seems a great way to make learning visible for those students._

We need real examples of everyday practice where all kids are supported. I think we need to hear about teachers’ struggles, school struggles, family and student struggles.

_Regardless of what approach they use, it seems schools can’t be inclusive unless they really own the student with the disability, know that student and know who they can go to - to support them and the student._

_It’s important that teachers and students get the right support at the right time with the right people. We have to make sure schools – and teachers really – get the message that they are not alone._

Team members commented on regularly seeing teachers who were very skilled at adapting and differentiating the curriculum, but who said that they felt isolated. Project members understood the need for schools to recognise that they often had great reservoirs of skill, and that creating networks of knowledge and support in their communities would allow those skills to be shared for the benefit of all. Creating successful inclusive practice begins with a culture of care and respect for staff, students and families (Ainscow, Booth & Dyson, 2004; Monchinski, 2010; Wink, 2011).

Feedback from early iterations of the work reinforced the importance of relationships with and within schools, and opportunities for ongoing dialogue when talking about creating change. It follows then that talking about inclusive practice in schools involves open, challenging and respectful conversations about children’s rights, about an ethic of care, about quality teaching for all, about supportive leadership and about knowing the learner.

Responses from the sector confirmed the desire to see what successful inclusion looked like. Some teachers said they would really value having someone come into their classroom and having practical conversations with them so they could learn more about being inclusive in their practice. Many teachers wanted practical ongoing support around differentiating the curriculum. One secondary teacher said:

_I get the theory, and I really want to do this, but no one seems to really know how I can make Year 13 English useful in my class for a student working in Level 1 of the curriculum. It’s the practical stuff we need._
A number of teachers expressed an interest in finding out more about learning stories, citing assessment for some students as a particular challenge. The project team recognised value in embedding practical examples of different approaches to assessment in the resources. These include teacher actions and their reflections on learning outcomes. When teachers read the stories of others, they are more likely to try something new and to then reconstruct their own stories (Clandinin & Connelly, 2000).

When thinking about potential to change, the project members recognise that telling a story is more effective than writing a rationale or guidelines. An example of this is the story of a family who had experienced some challenge around their daughter’s enrolment in a couple of local schools. The family had arranged an appointment with the principal of a different school they were considering for their family. The principal greeted the family and immediately addressed the child “Welcome [name of child]. I see you love wearing pink. I think you’ll have to meet [name of teacher] in Room 2 because pink is her favourite colour too. I think you two will get on famously”. The family reported feeling welcome and valued. “He saw our daughter, a kid - he took no notice of her chair”. The principal recognised the child’s sense of belonging as central to being in that school. A number of Ministry of Education resources similarly use stories to demonstrate authentic learning (Aitken & Sinnema, 2008; Alton-Lee, 2003; Ministry of Education, 2009a; Robinson, Hohepa, & Lloyd, 2009; Timperley, Wilson, Barrar & Fung, 2007).

THE IMPORTANCE OF LEADERSHIP

A consistent theme that emerged from the research and from sector feedback of draft project materials was that of inclusive values, beginning with school leadership. Leadership appears to be essential in supporting a culture where all students are valued and every student’s learning is important. Conversely, teachers and professional development providers commented that their attempts to be more inclusive were challenged by a lack of understanding within some leadership teams.

Timperley et al., (2007) identify two significant types of leadership. Transformational leadership focuses on vision and inspiration based on relationships. Pedagogical leadership places emphasis on establishing key educational goals, planning using the curriculum, and evaluating teaching and learning programmes. Research suggests pedagogical leadership is four times more effective in achieving intended outcomes than transformational leadership. Teachers were noted to value clear goals and expectations (Timperley et al., 2007). This is not denying the importance of relationships as schools recognised as high-performing value communication within school and with their communities. Meaningful school-wide reflexive practice that actively involves the school leadership team not only helps create a culture of respect but supports teachers to take risks and make changes in their practice (Lovett, 2007; Wenger, 2000).

One of the useful things I saw when taking this material to school for feedback was that it created a focus for meaningful conversations. I heard a couple of teachers in the staffroom talking about how they were going to introduce some sign language in school assembly and that learning a bit of sign so more people could communicate with [name of student] would be useful for everyone really. Talking together about stuff they could do quite easily.

WHAT WAS LEARNED, AND ONGOING CHALLENGES

This project team was supported by a skilled and knowledgeable sector advisory group, including a number of members from the disability community. One work stream sought external mentoring from critical friends, and the shared wisdom of these participants greatly strengthened the work of the project. As one team member said:

Our critical friends have been very important to me, as touchstones or markers along the way. They helped us know what was on track and off track. What a gift to have a group of people to share the learning journey with.

Macfarlane (2013) of the University of Canterbury talked about the purpose of assessment and the reality for many students. She suggested a concept to guide this work could be that assessment shall do no harm. This has real implication for pedagogical frameworks and for classroom practice. It impacts on how teachers assess, and what principals do with assessment data. Hipkins (2013) of the New Zealand Council for Educational Research talked about the creativity enabled by the NZC, and encouraged team members to imagine how teaching and learning could be different. Thinking creatively about teaching and learning could help teachers to grow student potential and to support student capabilities. Morton (2013) of the University of Canterbury talked about inclusive practice as a process of moving away from and moving towards. An example of this could be moving away from a one-off meeting and moving towards developing relationships and knowledge over time. It could be moving away from relying on
one source of information to make decisions about student capability, and moving towards drawing on the knowledge of the student, their parents, family/whanau and those supporting them. This way of thinking framed much of the work in the project. It provided a space for all to position and reflect on their practice, and to plan their own next steps in creating inclusive classroom and school communities.

The journey for some members of the project team involved personal and professional challenge. A number of iterations were drafted and rejected in attempts to create practical resources with transformative potential. Project members developed their own understandings of inclusive practice, enabling them to better support the sector in the variety of roles in which they continue to work:

I’ve learnt lots about inclusion. All kids have to have the opportunity to achieve in the NZC. That’s not negotiable. End of story.

Inclusion’s about an ethic of care; about thinking about teaching all kids better. I think it’s about a value of kindness being obvious right through the school.

Inclusion is not so much about theory or head knowledge – it comes from the heart!

Inclusive practice is all about the quality of relationships and how we treat other people. It is not just about the vision; it is about modelling it, persistence, working together.

As project members learned together, they became more cognisant and open to discuss the challenges they believed lay ahead:

I get so cross about that oh so damning statement that says something like - these learners are expected to spend a long time working within Level One of the NZC. What rubbish! Is so limiting and provides a weasel-out clause. Like they’re not expected to make progress.

A challenge for me is thinking about and talking about support staff. I often find when I ask the schools about their students with special education needs they immediately focus on the number of teacher-aide hours the students get, as if that’s the answer to being inclusive. I understand this - it’s so hard when schools are stretched to breaking point around resourcing the kids who need support.

I’m having discussions with a school about what they believe being inclusive is. It seems to me it starts with knowing the student well, then we can focus on the goals for that student and how we can achieve them. In my experience it’s not about teacher-aide hours. It’s - well it is about that a bit - of course teachers need support - but it’s really about the teacher feeling confident and feeling supported. It’s about knowing who to ask and having someone knowledgeable at your fingertips who you can throw ideas around with. Sometimes these people are in the school; sometimes they are specialists from outside the school who have amazing knowledge. It’s not about these knowledgeable people having set hours with the student; it’s about the teachers being able to have meaningful learning conversations with these people when the support is needed.

Some project members confronted their own thinking as they had conversations in schools about resourcing. Lack of resources was often cited as a reason schools felt they struggled to be inclusive. In some cases, limited teacher-aide support was a real barrier to meaningful participation in the classroom. In some cases, the barriers were not about resourcing but about attitudes.

You know some teachers still seem to think that the students with special education needs aren’t really their responsibility. I’m learning to be brave and say ‘Actually you’re the teacher; you’re responsible for all your students. What support do you need?’ Not easy for me.

In a culture where everyone is valued, the staff support each other and there are high expectations around learning for all students. Discussion about resourcing became more about supporting the teacher to teach all students rather than supporting a student by giving them teacher-aide hours (Ainscow, Booth & Dyson, 2006; Ministry of Education, 2014; Rutherford, 2008; Slee, 2011). Many students require additional support to participate at school and to meaningfully access the curriculum. This support is undeniably critical to successful inclusion for some students. Project members were challenged in some schools, when teacher-aides appeared to have responsibility for student learning. Some team members engaged in conversations where they questioned why expectations for students with special education needs were lower than those of their peers.

Some teachers recognised that students with complex needs have strengths that do not pigeonhole them within a curriculum level and that high expectations of all students begin with knowing the learner (Marshall, Ralph & Palmer, 2002; Rutherford, 2008; 2012). Students often demonstrate strengths in learning outside the school context, and meaningful relationships between school and family enable such
authentic learning to be recognised and transferred across settings. MacArthur (2009) notes that when New Zealand students with special education needs were asked what they wanted from school and how teachers could support their learning, they most wanted to be “part of the whole peer group” and to be “fully involved at school” (p. 42). Expectations for social and academic inclusion are equally valid for all students. A challenge in a busy school environment is valuing the process of inclusion sufficiently to take the time to connect with families, and to develop respectful and equal relationships in school. Without this connection, collaboration is not possible.

Teachers benefit from opportunities to share experiences and ideas with their colleagues to help create collaborative learning communities. Many of the teachers involved in trialling resources for this project said that having opportunities to work collaboratively and share experiences and ideas around inclusive practice helped them to develop confidence, to be more creative, and take risks to better include all students in classroom learning.

CHANGES TO PRACTICE NOW AND IN THE FUTURE

Project members completed their tasks and left the project in two stages. Those who left after three terms were able to provide valuable feedback on how participation in the project had changed their practice:

This work has completely reframed how I’m running my school. I thought we were inclusive but since I’ve come back, the school has been recultured. Everyone is taking this work on board - they don’t have a choice. It’s been about active management and active leadership. All kids need the opportunities to be the very best they can be. We’ve focused on presence and engagement for everyone. We will see a lift in achievement for all kids. I’m quite determined about that.

I just know how much more I have to learn.

I’m a lot more confident when I talk to people about inclusion. I also think I have become a more understanding teacher and a more determined advocate for social justice.

We have to remember when we talk to schools that we’ve been on a big journey. It’s like the Kingston Flyer. We might have already got to Lumsden, but many people are still somewhere further back on the track. We have to pick them up and take them with us.

The reality is schools will get on this inclusion train at different stations. The process of becoming more inclusive is about recognising that station, and making changes to travel further up the line (moving from and moving towards). Project members talked about their personal learning and changes they intended to make as they moved back to their work as practitioners. Comments included:

I need to continue to grow my knowledge of ways to support teachers who have students with high and complex needs, then support my colleagues to also grow their knowledge. One key focus area is the approaches schools are using to capture evidence to share the powerful stories of a student’s progress over time. I feel assessment knowledge is something we need to develop more and ensure all our facilitators have the skills to support their teachers and leaders.

I really thought I was inclusive but I’ve learnt a lot about listening to student voice. I really see how important this is and I’ve learnt some really useful strategies to achieve this.

NEXT LEARNING STEPS

Creating change in education is a many-pronged approach, from policy to practice across a range of contexts. The process of embedding change is seen as incredibly fragile, and one that needs ongoing practical and focused support. School leaders most successfully lead change when the decisions they make are informed by deep knowledge of effective pedagogy (Timperley et al., 2007). This is supported when they are able to engage in meaningful learning conversations, create a culture of trust and analyse and solve complex problems (Bendikson, Robinson & Hattie, 2012; Timperley et al., 2007).

For teachers, building capability requires understanding why new ways of doing things may be better than what they have done before. Useful professional development supports changes of deep understanding, not change that occurs at a systems or practice level only. Without embedded understanding there is no incentive to maintain any change to practice that emerges from professional development (Timperley et al., 2007). Ballard (2011) reminds us that meaningful change happens within big picture thinking. Efficacy of change at the front-line in classrooms is largely determined by teachers. This project work aims to help teachers to think critically and teach in a way that supports just and democratic classrooms, schools and communities. Wink (2011) suggests that change is most effective when it comes from the heart. Belief and passion are great motivators for progressing change. Recognition of existing
knowledge and skill within new learning is seen as pivotal to creating change. Teachers as change agents can transform classrooms to create authentic learning communities where everyone is welcome and everyone collaborates to support learning. As Ayers, Quinn and Stovall note, “we don’t really know how to change the world, of course; we don’t know when our efforts are in vain; but we do know that change in small places can gesture towards larger transformations, and that changing a single mind can unleash a universe of possibilities” (Ayers et al., 2009, p. 726. In Morton et al., 2012).

Inclusive Education Capability Building resources have been drafted, and the first stage of the project completed. Team members await the Ministry of Education’s progression, completion and implementation of this work in 2015. As the poet Colquhoun writes, team members have let this work go and trusted that the key messages they valued will be prioritised in the final product. They also recognised that, regardless of the nature of the final product, without an ongoing commitment to practical professional development, the tipping point may remain elusive. The project team have returned to their home towns and will endeavour to be agents of change in their own workplaces, striving towards a culture where all students can participate as valued members of their school communities to become “actively engaged lifelong learners” (Ministry of Education, 2007, p. 7).
